

FULL CODE PROCESSING PROMPT

One prompt - hand the whole 1348-page code to your agent

Delegates full-document coverage tracking and extraction to your building agent

Version 1.0
August 2026

1. How to Use This

- Attach/upload the full UAE Fire and Life Safety Code of Practice PDF to your coding agent along with this prompt - it needs the actual file, not just this description of it.
- Also point it to your existing backend/data/uae_fls_code_clauses_business_occupancy.json so it knows what's already been extracted and doesn't redo that work.
- This is one prompt, not a step-by-step series like before - you're delegating the judgment calls (what's checkable, what to extract, what to skip) to the agent itself, and asking it to report back rather than asking you to direct each step.

Expect this to be a long-running task. A 1348-page code document is a lot for one pass - it's reasonable for the agent to take a while, or to ask you to run it in stages. Don't be surprised if it comes back asking to split the work rather than doing all 1348 pages in one shot.

2. The Prompt

I'm attaching the full UAE Fire and Life Safety Code of Practice PDF (1348 pages). I need you to process it completely and turn the relevant parts into structured data my app can use - and tell me clearly what's covered and what isn't.

WHAT ALREADY EXISTS (don't redo this, verify and build on it):

backend/data/uae_fls_code_clauses_business_occupancy.json already contains real, sourced data from:

- Chapter 3 'Means of Egress', pages 235-350: occupant load factors, exit count thresholds, travel distance/dead-end/common-path limits, single-exit-door rules, stair and corridor width minimums, exit remoteness - for Business/Office occupancy specifically.
- Annexure 2 'Drawing Submission Requirements', pages 1283-1287: a checklist of presence/absence items (scale shown, room names labeled, cover page present, etc.) that Civil Defence uses to reject submissions before review.
- Building height classification (Lowrise/Midrise/Highrise/Super Highrise thresholds), from Chapter 2, section 2.8.4-2.8.7.

YOUR TASK - DO THIS IN THREE STAGES:

STAGE 1 - INVENTORY. Read through the full document and produce a chapter-by-chapter map: chapter number, title, page range, and a one-line judgment of whether it's mostly 'Bucket 1' (things a floor plan's geometry or metadata can actually prove - distances, widths, counts, areas, presence/absence of a labeled item) or 'Bucket 2' (things a drawing alone can't prove - material certifications, product specs, system design detail, administrative/procedural rules, anything needing a site visit or a document the drawing doesn't contain). Show me this inventory before extracting anything new, so I can sanity-check the plan.

STAGE 2 - EXTRACT. For every chapter/section you marked Bucket 1 and that ISN'T already covered by the existing JSON file, extract the real numeric thresholds or checklist items, in the SAME structure already used in `uae_fls_code_clauses_business_occupancy.json` (`clause_id`, `topic`, `occupancy`, `requirement_type`, `value`, `unit`, `condition` if relevant, `source_table`, `source_page`). Append to that file rather than creating a separate one, unless the content genuinely doesn't fit that schema - if so, tell me why before creating a new file.

STAGE 3 - REPORT. When done (or when you need to pause), give me a clear coverage report: total pages processed vs. 1348, which chapters are fully extracted, which were judged Bucket 2 and why, and which chapters remain untouched. Be honest about partial coverage - don't mark a chapter 'done' if you only skimmed it.

IMPORTANT RULES:

- Don't change any existing rules engine logic or database schema in this task - this is purely about building the data, not wiring it in yet.
- Where a number is ambiguous, unclear, or the PDF's scan/text quality makes you uncertain, flag it clearly rather than guessing - a wrong number in a safety code dataset is worse than a missing one.
- If the document is too large to process in one pass, tell me that directly and propose how you'd like to split it (e.g. by chapter groups) rather than silently doing a shallow partial pass over everything.
- This extraction is a starting point for engineering review, not a final legal source - note that in whatever you produce.

3. What Happens After This Runs

Once the agent reports back its Stage 1 inventory and Stage 3 coverage numbers, the next real decision is which newly-extracted Bucket 1 chapters to actually wire into the rules engine first - that's a judgment call worth making with the real inventory in front of you, not before. Bring the coverage report back here if you want help deciding what to prioritize.
